

Let water live again!

Healthy and Vital Water

with the Aquarius Vitaliser®

Nitrate, hormones, pesticides, herbicides, new chemical substances, and medicine residue.... they are increasingly prevalent in our drinking-water. The ever increasing influence of electrosmog is also affecting the quality of water.

Aquarius Technology

Properties of vitalised water:

The structure of water after treatment with the Aquarius Water Vitaliser is visibly thicker than that of normal tap water and source water.

Vitalised drinking-water has a softer taste.

Vitalised water can support or strengthen your immune system.

Vitalised water is a boon for skin and hair.

Vitalised water can enhance parasitic resistance in humans and animals.

Vitalised water enhances nutrient absorption.

Vitalised water can improve the health condition of animals.

Vitalised water can contribute to a healthy, fit and vital body.

Vitalised water unburdens the liver and kidneys and improves blood circulation.

Vitalised water cleans the cells through the body fluids, tissues and organ systems.

Vitalised water has a deep-acting detoxifying effect on the body.

Vitalised water can eliminate or diminish skin allergies and over-sensitiveness.

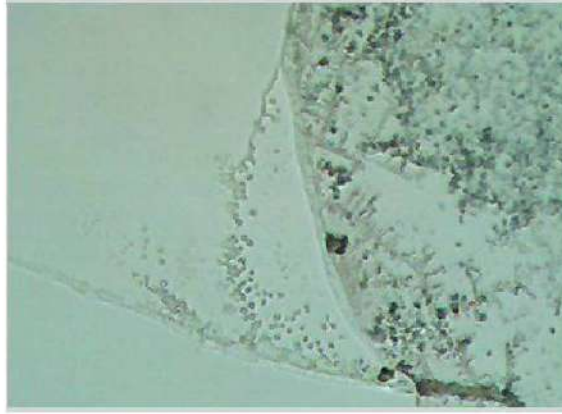

Vitalised water is freed of harmful vibration frequencies and has regained its harmonious balance.

Vitalised tap water is delicious to bathe or shower in, and instantly provides a tired body with energy.

The Aquarius Vitaliser® can transform harmful vibrations in water so as to give water its vital power back.

Very often water contains right-angled crystal structures as a result of various forms of stress.

Research has demonstrated that this stress is pathogenic.

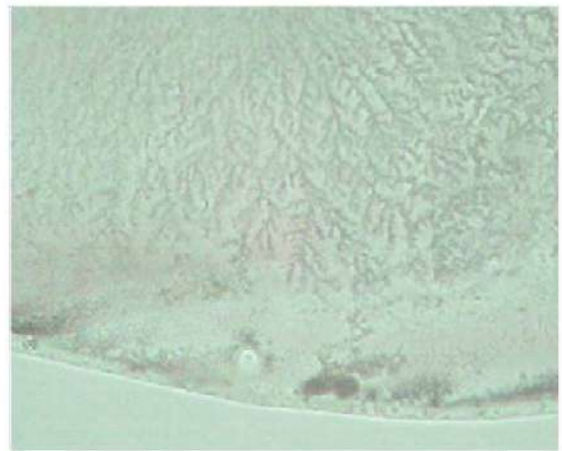

This is the structure of unorganised water: the right-angled structures are clearly visible on this image. This type of structure in the water causes disease.

After installation of the Aquarius Vitaliser® behind the main tap and water meter, you will enjoy vitalised water out of every tap in your home.

This organic structure becomes clearly visible after the water has gone through the Vitaliser. The crystal structure of good water contains angles of 16 to 60 degrees.

This is a property of organised and healthy water.

Healthy Water is Essential

Water is an essential element for all our body functions, and those of animals and plants.

There is a general tendency to merely pay importance –or pay attention – to the transport function of water, i.e. for the absorption of nutrients and drainage of waste.

The other extremely significant role of water, which is to transfer the energy and information necessary for the control of all body functions at all levels, from organ to cell, is becoming increasingly apparent. The essence of 'water' plays a vital role in this, and is insufficiently recognized by medical science.

Water is chiefly being examined on its chemical and biological composition and functioning.

Scientific knowledge of information and energy storage by the water in body fluids and transfer through the water of body fluids in relation to the processes in the human, animal and plant body is still in its infancy. Literature on the analysis and functioning of cells extensively describes the structure of many types of cells, as well as the functions of all the particles that make up a cell.

None or hardly any attention is being paid to cell fluid, even though it constitutes 75% of the cell content.

It is exactly this intracellular water that plays a crucial role and is the carrier of life. This is also true for the water around the cells. In particular, water in the connective tissue plays a central role in the body processes (just think of the influence of electromagnetic radiation from mobile telephones, DECT, UMTS, C2000 etc.).

Connective tissue not only serves a supporting function because it fills up the space in between cells, it also functions as a basic control system, because the extremes of blood vessels, nerves and lymphatic systems all begin and end in the connective tissue.

Blood vessels, nerves and cells are not directly connected with each other; they are through the connective tissue.

Transport of nutrients and waste, as well as information transfer take place via the water in the connective tissue.

Biophysical research has demonstrated that water that has been drunk indeed reaches the connective tissue, and that high quality drinking-water can bring about regeneration of cell metabolism.

An Aquarius Vitaliser® for every type of usage

A variety of versions of the Aquarius Vitaliser® are available.

The house, garden and kitchen Vitaliser has a capacity of 8,000 litres per hour, and is equipped with a 1" (inch) threaded inlet and outlet. This type of Vitaliser is suitable for pipes between 15 and 42 mm.

Different types and sizes:

- The 2-inch Aquarius® Vitaliser has a capacity of 28,000 litres per hour
- The 3-inch Aquarius® Vitaliser has a capacity of 50,000 litres per hour
- The 200-mm Aquarius® Vitaliser has a capacity of 200,000 litres per hour

Specific usage conditions?

It is of course possible that the water usage of your business, institute or company doesn't match the capacity of one of our four standard models. No problem. After consultation about your specific needs, we will design and produce an Aquarius Vitaliser® which is a 100% tuned to your needs. Tailor-made so to speak.

KIWA approved materials

The Aquarius Vitaliser® is made of durable materials approved by KIWA, THE certification organisation in the water and energy sector. All materials are resistant to pressures up to 16 bar. The product is completely maintenance free, so that once installed it needs no further looking after. It doesn't consume electricity either. In other words, no further cost after purchase.

A Few Applications with Good Results

Very positive results have been achieved in horticulture

“Since we started to use the Vitaliser, vegetables taste like they used to again. Vital water in combination with fertilisation using calcareous shells, compost and clay minerals enable healthy cell division. The latter is of great importance.”

The Aquarius Vitaliser® is also a Great Help in Agriculture

“Usage of the Aquarius Vitaliser® has drastically decreased the need for spraying crop protection products. In addition, flower bulbs keep longer, and mould and rotting problems diminished substantially.

Vitalised Water and Application in Horticulture and the Soft-Fruit Sector

Due to use of the Vitaliser scale and iron deposit is substantially lessened. The colour of the flowers is much brighter using vitalised water, and the root structure much fuller.

Thanks to the Vitaliser one can use significantly less fertiliser on plants, while they still grow well and have better resistance to a variety of plant diseases.

The Vitaliser can be installed directly behind the water pump. However, it is also possible to use the Vitaliser inside the pump system of the pre-docking or reservoir basins.

Due to colloidal dissolved minerals in the water, more nutrients become available to the plants. Moreover harvested fruits, roses and other cut flowers can be preserved longer.

The production of vital consumption eggs

“After installation of the Aquarius Vitaliser® egg production went up magically, while health expenses have been reduced by 50%. After the Vitalisers were installed, I immediately noticed the chickens dispersed over the entire coop again.

This was different before the arrival of the Vitaliser: usually all chickens were sitting

together in the front of the coop. This phenomenon proves that the Vitaliser is also active in the soil.” (Troublesome water veins)

The Aquarius Vitaliser® in cattle farming

“Healthier animals. Decreased somatic cell count in the milk. Higher protein-content in the milk. Because the minerals present in the water are colloidal dissolved, they can be absorbed more easily by the animals, and promote electrolyte and mineral balance.”

In pig farming optimal results are equally achieved with the Aquarius Vitaliser®

“Better fodder conversion because of enhanced fodder absorption by the body.
Medicine use can be drastically reduced.
Much healthier animals.
Higher number of weaned piglets per litter.
The animals are significantly calmer with vitalised water.

In short, the Aquarius Vitaliser® can be applied everywhere.

Application of the Aquarius Technology with different complementary H2O products

Water has a memory and is capable of storing vibration frequencies, as well as retaining and emitting them again.

This knowledge can be applied to the production of so-called complementary water for medical purposes, among others.

The active substance in a medicine always has a specific vibration frequency. By registering this frequency in a special type of ceramic, and then bringing this in contact with water, it is possible to copy the vibration frequency onto the water. When this “informed” water is then drunk, the vibration frequency can perform its work in the body without side effects or extra burdening the organs.

An example of this is the administration of a worm treatment or a vaccination to animals. Normally, this burdens the intestinal flora and organs and weakens the immune system.

This is usually one of the causes of a temporary relapse in production or growth. When complementary water is used, however, one does not suffer from decline in production or growth, because the immunity of the concerned animals is not weakened.

What happens is merely that the frequency comes in contact with the water inside the body, and is poorly tolerated by parasites and worms.

Consequently, these acutely leave the body through the stool.

This science can be widely applied to humans and animals, in agriculture and horticulture, etc. And it is 100% safe, without adverse side effects or unwanted resistance build-up. The results are so far very encouraging, and may contribute to safe and healthy food.

Electric and regular colloidal silver brisers - Brijvoedings briser - Liquid food briser

Water is the most abundant molecule in the universe

Despite its simple composition - two hydrogen atoms and one oxygen atom - water possesses very special properties. It is ideally suited as a solvent and as a medium for all kinds of chemical reactions and physical processes.

The molecules of most substances break up into two or more electrically charged particles (positive and negative ions) when put in contact with water, resulting in a lively exchange of components between the molecules.

Furthermore, water is the basis of osmosis: one-way traffic through cell walls and membranes. Metabolism in every living cell occurs through osmosis, as well as the regulation of cell fluid pressure.

The body emits biophotons, electromagnetic frequencies, heat, sound, and smell. The nature of this emission is directly dependent on the condition of the body. We're talking about illness, health, happiness, stress, etc. In this manner, the body emits subtle information.

Biophotons (bio=life, photon=light emitting particle) are in this respect less known, but nevertheless very interesting.

Every living being (including plants and bacteria) produces and emits these particles, whether or not reinforced. Phenomena such as energy pathways, vital force and Bovis-value are easily explained by means of biophotons.

Biophotons can be made visible with direct photography, where the object is placed directly onto a photosensitive emulsion (Kirlian photography). The halo size, colours, etc., thus give us a picture of the energy status of the object.

Since this is making inner vital energy visible, it is also an overall measure of quality.

Biophotons can also be made visible through the use of chromas. With chromas, different organic fractions are made visible using a special kind of paper.

The structure, shape and colour of the chromas are indicative of the inner energetic quality of the studied object.

The energetic value is quantifiable by means of the Bovis-value.

This is a subjective, yet repeatable value assessment of substances, seeds, plants, animals, foodstuffs, etc.

The following values are used:

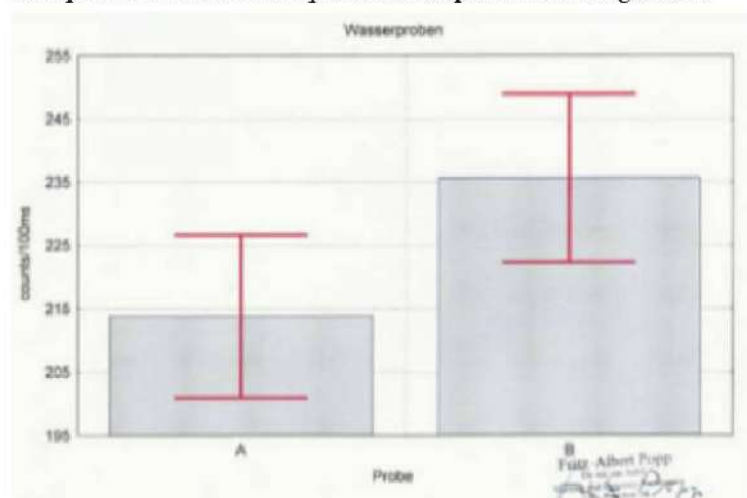

Bovis-value: 0-3000 pathogenic
3000-6500 unhealthy
6500-7000 neutral
7000-8000 healthy
8000-and up vitalizing

Vital water strengthens your body's resistance against external

SCIENTIFIC RESEARCH

It is not easy to find scientific research on the 'possible' memory of water. However small steps are being taken. Prof. Dr. Fritz-Albert Popp of the IBB (International Institute for Biophysics) in Neuss, Germany, for example, has developed a method for studying water that he calls aquascopy [14]. This method makes use of very weak light and works as follows: The water sample to be studied is placed in a dark room. After some time the water is given an electrical pulse. Next, the amount of light, or the number of photons emitted by the water, is measured. Popp developed this method on the basis of his research on biophotons.

Popp is another scientist who was initially scoffed at because of his research. Nowadays, he's a respected scientist who publishes in prominent magazines.

During a visit to the IBB, it was clearly visible in the measurements that the amount of light emitted by water brought over from Amsterdam changed when it was what we call "vitalised". The manner of vitalising was to guide the water alongside a special type of ceramic, thus giving it more vitality. This practise with water is scientifically contested and not yet understood. While

in reality good results have already been achieved, the method has not yet been explained. Nevertheless, research through two different methods proved there are indeed measurable effects.

Professor Popp said: "We get the most diverse cases here. Many people claim they want to do something with water and want us to test it. In many cases we can't see anything, but this case shows an obvious change in the measured value, though in the physical and chemical sense the water hasn't changed. This is a wonderful phenomenon that we cannot explain yet."

Popp underlines his measuring method is still young. "From the theoretical perspective there is still little we can say about actual changes taking place in water."

The aforementioned water sample was vitalised with an Aquarius Vitaliser®.

For the full test report: <http://www.watishwater.nl/page2/files/watishwater.pdf>

Vitalised water has shown in practise to have a significant influence on the cell fluid. This is caused by a change in the surface tension of water. Despite various survey reports on the harmfulness of electromagnetic radiation, ever more pylons simply continue to be installed.

In order to strengthen defences against the effects of this radiation, vitalised water is a well-functioning remedy for humans, animals and plants

How does electromagnetism affect our body?

The magnetic field of the earth has a significant influence on plants, animals and humans. For example, many animals use it for orientation, and the formation of red blood cells in humans is highest when sleeping in the North-South direction.

Interferences in the Earth's magnetic field tend to cause sudden increase in the number of acute illnesses, especially cardiovascular problems.

Because they penetrate everything so easily, magnetic fields have a major impact on all organs, including the control centres. Our nerve endings are very sensitive receptors, even more during sleep than during daytime.

"The brain, with around ten billion nerve cells, forms a complex network of thousands of branched communication channels. The communication that takes place in here consists of electrochemical processes at the lowest energy level. For example, American researchers have measured magnetic field tensions of 1 nGs (0,000000001 Gauss) and electric field values of around 1 $\mu\text{V}/\text{m}$ at nerve endings.

The frequency of brain currents penetrating through the skull, measurable on the scalp surface (and recorded in the "electroencephalogram", EEG), varies between 0,3 and approximately 60 Hz, where the measurable potential difference amounts to about 5 to 250 μV , depending on the brain activity. But the skin also contains billions of nerve endings.

These nerve endings are extremely sensitive to the slightest variations of electric fields and to minimal magnetic changes, that one can say they cause the human body to be an extremely sensitive antenna.

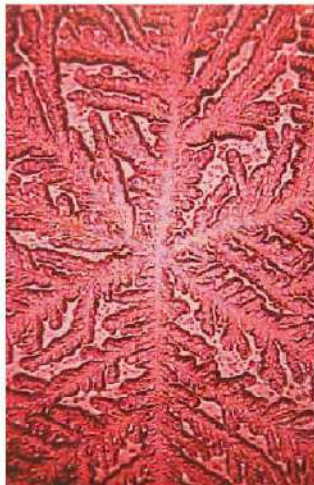

That this is indeed true can be easily determined by connecting to the human body a sensitive frequency selective voltmeter used by radio and TV mechanics.

This device shows that the skin surface of the body absorbs EM radiation in thousands of frequencies. (...) Therefore there is no doubt that external artificial electric fields act upon the natural electric currents in the human body, upsetting or even completely suppressing the control processes naturally present in the body."

These control centres are:

1. *“The central and autonomic nervous systems*
2. *The endocrine glands, which regulate hormonal metabolism in correlation with the outer world (endocrine glands that deliver their secretions directly into the blood stream, including: thyroid, adrenal gland, pituitary, islets of Langerhans, etc.)*
3. *The enzyme system*
4. *The immune or defence system”*

The influence of electromagnetic radiation on our cell

Blood crystal analysis, unaffected by mobile telephone use.

Crystal analysis of blood of a person who regularly uses the mobile phone

Body cells are assigned different functions during the embryonic development. This cell specialisation is brought on by cytoplasm (cell fluid) division. During cell division, cytoplasm is always divided in a certain way. Substances from adjoining cells influence each other's development. This process always causes certain cell genes to be switched on or off.

One fact is undisputed: the high-frequency electromagnetic radiation from mobile telephony also leads to warming of the human tissue.

There is now more electromagnetic radiation being produced on Earth than reaches her from the sun.....

Atmospheric pollution is an assault on the amount of vital oxygen. Magnetic fields from satellites, transmission pylons, high-voltage power lines, mobile telephony and other communication equipment decay the oxygen so badly needed by all life on earth.

Emergence of the so-called halo effect causes electrons to be released around transmitting antennae and guide wires.

These electrons chemically activate gas molecules, so that new chemical compounds come into being.

Oxygen is for instance being ionised, whereby a few molecules transform into ozone: it is important to note that the ratio of 1 part ozone in 12 million parts oxygen is considered dangerous.

In the same way nitrogen oxide is produced, a component of photochemical smog. Nitrogen oxide is even ten times more poisonous than ozone, and in combination with rainwater forms acid rain.

The ion balance

We know that air consists of different gas molecules, which are in turn made of atoms. Atoms are made up of a core containing a certain amount of positively charged particles (protons) –the factor differs by element–, which are enveloped in one or more shells with negatively charged particles (electrons).

The atom is in itself electrically neutral: when the number of protons in the core equals the number of electrons, the result is a neutral entity because the positive and negative charges outdo one another.

Initially molecules are also electrically neutral. They are formed by atoms when they link, or when one atom cedes an electron to another, or when atoms mutually share one or more electrons. When atoms or molecules now for some reason loose electrons (particles with a negative charge), they become positively charged, because the core's positive charge has become greater: they become positive ions.

If on the contrary they pick up electrons, they become negative ions, because then this negative charge becomes greater than that of the core.

Under normal circumstances, ions usually are naturally in balance. The normal ion concentration in the air lies, for instance, between 1,000 and 2,000 ions per cubic centimetre,

with a ratio of 5 positive to 4 negative ions. This shows that the air has a certain positive charge, it is slightly ionised, and this is vital for the development of organic processes and oxygenation of the cells.

The Aquarius Orgon Beamer for More Negative Ions

When researchers tried to keep mice, guinea pigs and rabbits and the like in an ion-free environment, the animals all died very quickly.

In addition, experiments have shown that plants grow spectacularly in an environment with mainly negative ions, far better than under any other circumstances.

We can perceive in different ways that an excessive count of positive ions is harmful to health.

Dust particles present in the air intercept negatively charged ions, resulting in a denser concentration of positively charged ions.

Worldwide temperature measurements have demonstrated that when radio stations were first put into use, global temperatures increased by about 0.7 degrees.

The slight increase was measured for the first time around 1920, when the first long-wave transmitters were employed.

The next, higher temperature rise was measured around 1940 when short-wave transmitters were introduced. An extremely rapid rise was measured from the 50's onwards, in parallel with the introduction of ever more new transmission techniques.

If one compares the rapidly increased environmental damage of the last 50 years to the simultaneous rapid increase of employed transmission equipment, parallels can no longer be ignored.

Before 1920 43% oxygen was measured in the air, nowadays only 20.9% oxygen is measured, while in some large cities this is only 10%.

Humans need about 14% oxygen in order to live well !!!!!!!

Around 41% of humanity gets less than 10%, and a strong downward trend persists.

The future or downfall of humanity depends on the fertilisation of the soil

Food is essential for life as a source of energy. If one can speak of healthy food, it implies that less healthy and even harmful food also exists. Most human diseases are caused by poor nutrition.

The soil in which crops are cultivated has long been inadequately provided with minerals and trace elements.

In addition, certain fertilisers are being misapplied. This, in combination with acid rain kills the soil bacteria.

Another cause is the so-called mycorrhiza (the symbiotic association between roots, flowering plants and fungi).

Again and again to my dismay, I find many farmers injecting rotting semi-liquid manure into the soil.

By doing this they destroy the beneficial soil bacteria, microorganisms and fungi necessary for the formation of humus and minerals.

Often afterwards they will sprinkle some fertiliser in the form of nitrogen, otherwise nothing would be growing at all. Crops grown on this kind of soil are pathogenic food for humans and animals.

This has serious implications for the survival of humanity, which is also evident from the fact that more health problems occur now than ever before. Just look how many children nowadays have ADHD, people having skin problems, intestinal problems, etc. etc.

Drinking milk today ensures a 45% higher risk of bone fracture, because the body can no longer absorb the calcium present in milk. Health care becomes unaffordable due to poor nutrition, poor drinking-water and a massive influx of electromagnetic fields.

Radical reform is needed

What does really happen in the soil with the current methods of fertilisation? I'll try to explain it in a simple way to make myself understood. In normal soil, three types of microorganisms are found, namely a small group of beneficial microorganisms, a large group of harmless microorganisms, and a small group of pathogen microorganisms.

If one administers rotting semi-fluid fertiliser to this soil, the group of pathogen microorganisms will prevail, because the harmless microorganisms will adhere to the pathogen microorganisms. And together they will destroy the beneficial microorganisms.

This process brings forth toxic (poisonous) substances, which are in turn absorbed by the crops cultivated on this soil. When humans and animals eat this food, it causes problems in the body, with all evident consequences.

In addition, the use of artificial fertilisers brings forth uncontrolled cell division that also affects the human and animal body, because food is no longer in balance. A good example of this is that more and more people are plagued with vitamin B12 deficiency.

This is a vitamin that used to be present naturally in milk, cheese and beef, but nowadays is almost completely absent.

I will explain the cause of this. If the trace element cobalt is unavailable to a cow, she will be unable to produce vitamin B12. How does vitamin B12 originate in the soil? Which processes lead to the formation of this vitamin? Lactic acid bacteria in the human and animal intestine naturally produce Vitamin B12, provided cobalt traces can be found in the diet.

Therefore, no vitamin B12 without cobalt. Because vitamin B12 possesses a cobalt core, it is also called cobalamin. How does vitamin B12, which has the property of an enzyme, end up in the soil? Based on the latest findings, vitamin B12 is produced in the root environment and in the root of plants, insofar as the trace element cobalt is present.

The connection is as follows: as soon as a plant turns green an exceptional flora of microorganisms develops in its rhizosphere (the vicinity of the plant root) as a result of chlorophyll being formed. This exceptional flora of microorganisms lives in symbiosis with the plant's fine hair roots.

Involved are mostly the same species of bacteria that act as symbionts in humans and animals, namely the bacteria that produce lactic acid.

Now, when the trace element cobalt is present in the soil, vitamin B12 or cobalamin can be formed uninhibitedly.

The elderly among you may still remember that farmers used to sprinkle Thomas flour (slag) in early spring, which contained precisely the substance cobalt. These farmers had more sense of the soil than many of today's educators in agriculture and horticulture, or the authorities, who have made low emission fertilisation of the soil mandatory.

Examples of vitamin B12 deficiency are metabolic problems and glossitis (inflammation of the tongue).

Invisible chemistry

Research on toxic substances in rainwater

A recent study by TNO, the primary purpose of which was to determine the atmosphere's role in the transport of persistent substances, established the presence of hazardous chemicals in air and rain. Exposure to certain chemicals affects hormonal balance.

Nowadays a lot of attention is being paid to the so-called xenoestrogens: synthetic compounds that interact with hormone receptors, which in turn may have an impact on reproduction and development. A current study commissioned by Greenpeace is specifically aimed at determining the presence and concentration levels of xenoestrogenic compounds in atmospheric deposition.

Rainwater samples were collected by Greenpeace Netherlands in four weekly periods in 47 locations in the Netherlands, 2 in Germany, and 1 in Belgium. The samples were analysed by the laboratory of TNO's Department of Environmental Quality and Analysis for bisphenol-A, alkylphenols and ethoxylates, phthalates, flame retardants and synthetic musk compounds. A number of pesticides, which are regarded as xenoestrogen substances, were not analysed because they have been studied in the previous TNO study.

The results of the study indicate that abovementioned substances are present in rainwater. With the exception of brominated flame retardants, individual substances of the other groups frequently occur and are found at most of the locations. Concentration levels range from the low ng/l zone for flame retardants to a few thousand ng/l for phthalates. Bisphenol-A was found in 32% of the samples at levels up to 357 ng/l, while alkylphenols and ethoxylates were found in nearly all locations in concentration levels up to 924 ng/l for the individual components. Phthalates were by far the most prevalent xenoestrogens and were found in all deposition samples.

On one location diisodecyl phthalate was even found in a surprisingly high concentration of nearly 100,000 ng/l. Brominated flame retardants, which were through this study for the first time detected in rainwater, occurred in approx. 28% of the samples in concentration levels below 10 ng/l. A remarkable exception was hexabromocyclododecane, a substitute for polybrominated diphenylethers, which was found in one sample in a concentration of almost 2,000 ng/l. Finally, a number of polycyclic musk compounds was found in nearly every sample as expected, with a maximum concentration level of 147 ng/l. Nitro musk compounds were furthermore found in approx. 30% of the cases. In addition to determining the presence and concentration levels of these

substances, this study also said something about the presence of emission sources.

By using Kriging techniques it is possible to interpolate data and thus display regional deposition data in the form of contour maps. These maps clearly show that in general there is more or less uniform, sometimes high concentrations at all locations, suggesting diffuse emission sources, as well as a number of local emission sources, point emissions, in particular for the substances bisphenol-A, nonylphenol ethoxylate, phthalates (DEHP and DINP) and AHTN, a polycyclic musk.
